

Platform

Merge Agent Handler

Best for: Multi-connector product teams

Auth0 for AI Agents

Best for: Teams already on the Auth0/Okta stack

GitGuardian

Best for: Dev-heavy organizations managing credential sprawl

Pros

Tool connectivity and authentication management; Security Gateway scanning every tool call for PII, PHI, payment data, and custom regex patterns; complete audit trail; Tool Packs simplify multi-connector access at scale

Authentication, authorization, Token Vault, CIBA, and Fine-Grained Authorization (FGA); out-of-the-box integrations with AI frameworks including LangChain and LlamaIndex; pricing scales in tiers by monthly active users, giving smaller deployments room to start cheap

Secrets exposure detection; non-human identity (NHI) discovery identifying which agents can impersonate which identities; agent lifecycle visibility; behavioral monitoring (private beta) flagging autonomous agent anomalies

Cons

Out-of-the-box connector coverage limited to "dozens" of pre-built connectors, with the list still expanding; connectors outside that set require building via Connector Studio and waiting for Merge's team to review before production use

Free tier capped at 25,000 monthly active users; teams exceeding that must move to a paid plan sized to their user volume

Free tier scoped to teams of 25 contributing developers or fewer; paid trial starts automatically once that limit is hit
